

NORTHWEST FLORIDA SPECIES LIST

This list, which contains shells found in the onshore and offshore waters of the Florida Panhandle, was prepared by the members of the Gulf Coast Shell Club. The list is arranged alphabetically by family. The numbers to the left of the shell name refer to the corresponding species as found in *American Seashells, Second Edition* by Dr R. Tucker Abbott. An asterisk indicates that a name change to the family, species, genus, (or all) has occurred since publication. Shells annotated with a superscript 1 indicate form names that may or may not be valid but are useful for identification. Shells annotated with a superscript 2 are shells from the 1994 Keeler and Robertson survey of the Apalachicola Marine Estuary and immediate offshore areas. These represent species not currently collected by GCSC members that are deemed native to our area. Columns have been added to reflect the most frequently used common name for the shell and its normal adult size range. There are 627 shells (including forms) on this list as of the latest update in May, 2011. Our thanks goes to Dr. Harry Lee of the Jacksonville Shell Club for his assistance in this compilation.
